

Chris Somerville: Arabidopsis Lipid Metabolism 1/23

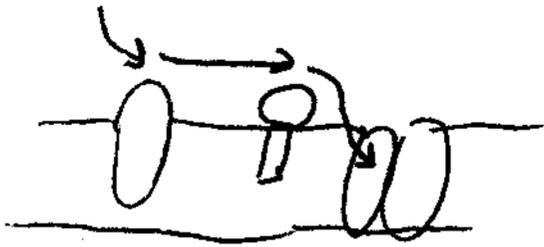

Plant Sulfolipid - may f(x) as a surrogate for phospholipids when P starved

Plants & lipids

- mt vs cpsts have v. diff. lipid composition (70-wise)
- freezing effects likely lipid dependent
- lipid metabolism for membranes related to that for storage

Arabidopsis Lipids

- variation in composition w/in plant
- Problem - many of the enzymes are not soluble.
- but 1 is soluble

Desaturases are membrane embedded

Solution

- brute force ... can ~~not~~ mutagenize at v.v. high levels and use chromatog. to detect mutants
- have mutants for virtually every step
- mutants have virtually NO PHENOTYPE other than chromatogram and some mutants have higher growth rates at high T₀.

Except
MUTANTS were not as viable for long term in low T₀.

Fluorescence

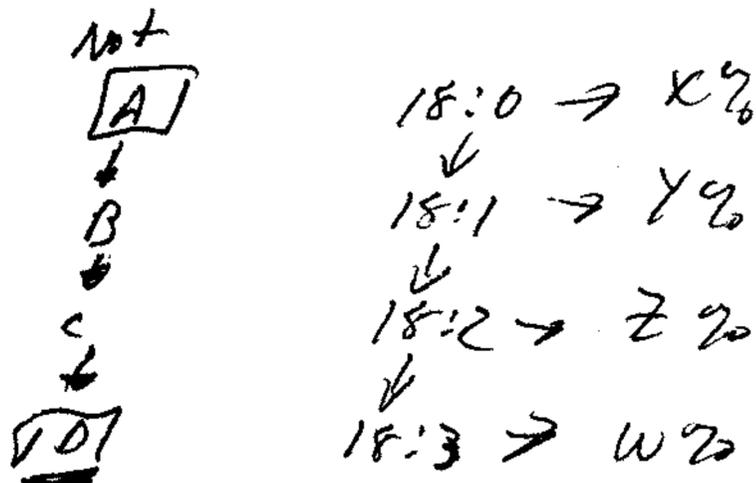

- can use to monitor changes in membranes

Mapping Mutations

- Arab. 70,000 Kbp DNA
- mapped Fad3 to nearest RFLP
- took VAC and probed cDNA library

Pathway

all elements of pathway are functional and accumulate to specific levels.

Freezing

Problem - as ~~ice~~ ^{not fluid} freezes osmolarity ^{in cell} increases in non-frozen part & shrinkage! happens.
